System Issues: Technical Worksheet

Grade 8 · Worksheet · About 25 minutes
Work with pen and paper. Use color pencils if you like. You do not need a computer or the internet.

Name: _____

Grade/Section: _____

Date: _____

> **How to use this worksheet**
> - Do the parts **in order** from top to bottom.
> - Each part has a **time** so you know how long to spend.
> - Read every instruction before you write. You can do this on your own.

Part 1 – What you will learn (about 3 minutes)

What you will learn: A **system issue** is when hardware, software, network, or configuration stops a service from working as expected. You will classify issue types, describe symptoms with evidence, run basic **isolation** questions, and decide when to restart versus document and escalate.

Do this:

1. **Describe one system issue** you have seen (black screen, no Wi-Fi, app crash, login failure).

   _____

2. **Write the first symptom** people noticed.

   _____

Part 2 – Types of system issues (about 5 minutes)

Classifying helps you choose the first tests: **hardware** (physical parts), **software** (apps/OS), **network** (connectivity and online services), or **configuration** (settings, accounts, permissions). Wrong categories waste time.

> **Real-life scenario:** Nobody in the lab can open the online classroom, but local files and offline videos still work. Monitors and projectors are fine.

Discuss with a partner or reflect in writing: Why does this case point more to network or an online service than to a broken screen?

Do this: Label each case **Hardware**, **Software**, **Network**, or **Configuration**.

Situation	Type
Ethernet cable is cut behind the desk	_____
An app crashes whenever one specific file opens	_____
The account has no permission to print	_____
Fan fails and the device shuts down from heat	_____

Part 3 – Symptoms, isolation, and evidence (about 5 minutes)

Strong diagnosis records: **what fails**, **since when**, **how many devices or accounts**, and **what changed recently**. Change one variable at a time. Capture error text—guessing without evidence slows everyone down.

> **Real-life scenario:** Only computer 7 cannot print. Computers 6 and 8 work. Yesterday someone moved desk 7 and the cable looked loose afterward.

Critical thinking: What first test would you run, and what evidence would you look for?

Do this: Write three isolation questions for the report “Wi-Fi keeps dropping.”

1. _____
2. _____
3. _____

Part 4 – Restart, document, and escalate (about 5 minutes)

Restarting may clear temporary states, but it is not analysis if the issue returns. **Documenting** (symptom, tests, result) helps support staff. **Escalating** means requesting help when risk or complexity is beyond safe self-repair.

> **Real-life scenario:** A student restarts three times a machine that smells like burning and keeps forcing power on. The odor signals a possible electrical fault that needs an adult or IT—not more retries.

Do this: Mark **Restart first**, **Document & report**, or **Stop & get help**.

Situation	Best action
An app froze once; no smell or heat	_____
The same error returns each morning with a visible code	_____
Sparks at the outlet	_____

Write a short incident note (symptom / test done / next step).

_____

_____

_____

Part 5 – Diagnosis map (about 5 minutes)

Do this:

1. **Draw a flow**: Observe symptom → Classify type → Isolation questions → Safe test → Resolved? → Document or escalate.

2. **Mark the step** people most often skip in your setting, and explain why it matters.

Part 6 – Check what you learned (about 2 minutes)

Checklist. Put a ✓ in the box when it is true for you.

☐ I can explain what a **system issue** is and give an example.

☐ I can classify issues as **hardware, software, network, or configuration**.

☐ I can ask **isolation** questions and use symptoms with evidence.

☐ I know when to **restart**, when to **document**, and when to ask for help.

☐ I can sketch a basic diagnosis flow.

When all boxes are checked, you have reviewed the main ideas from this worksheet.

Worksheet on System Issues (Technical). Central topic: System issues. Main technology area: Systems support and reliability.
