UX Input Design: Technical Worksheet

Grade 9 · Worksheet · About 25 minutes
Work with pen and paper. Use color pencils if you like. You do not need a computer or the internet.

Name: _____

Grade/Section: _____

Date: _____

> **How to use this worksheet**
> - Do the parts **in order** from top to bottom.
> - Each part has a **time** so you know how long to spend.
> - Read every instruction before you write. You can do this on your own.

Part 1 – What you will learn (about 3 minutes)

What you will learn: UX input design shapes how people enter information: labels, defaults, feedback, constraints, and flows. Strong design reduces friction and errors.

Do this:

1. **Name an app or site form** you use often.

   _____

2. **Circle** a UX input concern: Clear labels + feedback · Hidden required fields with no hint

Part 2 – Labels, affordances, feedback (about 5 minutes)

Every field needs a clear **label**, a visible **affordance** (it looks typeable/clickable), and **feedback** (success, error, progress). Silence after submit confuses users.

> **Real-life scenario:** A “Join club” button does nothing visible for 8 seconds while the server works. Users click five more times and create duplicates.

Discuss with a partner or reflect in writing: What feedback should appear immediately?

Do this: Circle **Yes** or **No**.

Element	Good UX? Circle
Label above field in plain language	Yes · No
Error text that says only “Invalid”	Yes · No
Disabled button + “Saving…” state	Yes · No

Part 3 – Constraints and defaults (about 5 minutes)

Constraints guide valid input (date pickers, numeric steppers). Sensible **defaults** speed experts but must not trick beginners into wrong choices.

> **Real-life scenario:** A permission checkbox is pre-checked to share location. Many teens miss it and share unintentionally.

Critical thinking: When are defaults helpful vs manipulative?

Do this:

1. **Give one helpful default** example.

   ---

2. **Give one manipulative default** example.

Part 4 – Progressive disclosure (about 5 minutes)

Show only needed fields first; reveal advanced options later. Overwhelming first screens raise abandonment.

> **Real-life scenario:** A student account form asks for 25 fields including rarely used admin codes on page one. Half the class quits.

Discuss with a partner or reflect in writing: Which fields belong on step 1 vs later?

Do this: Circle a placement.

Field	Step 1 or Later?
Full name	Step 1 · Later
Optional newsletter preferences	Step 1 · Later
School email	Step 1 · Later

Part 5 – Wireframe an input flow (about 5 minutes)

Do this: Wireframe a 2-step input flow for event signup (boxes + labels + one feedback message).

Annotate one constraint and one default.

Part 6 – Check what you learned (about 2 minutes)

Checklist. Put a ✓ in the box when it is true for you.

☐ I can explain core **UX input** ideas (label, feedback, affordance).

☐ I evaluate **defaults** and constraints.

☐ I use **progressive disclosure** thoughtfully.

☐ I can critique silent submit states.

☐ I can wireframe a short input flow.

When all boxes are checked, you have reviewed the main ideas from this worksheet.

Worksheet on UX Input Design (Technical). Central topic: UX input design. Main technology area: User experience and forms.
