UX Metrics: Technical Worksheet

Grade 11 · Worksheet · About 25 minutes

Work with pen and paper. Use color pencils if you like. You do not need a computer or the internet.

Name: _____

Grade/Section: _____

Date: _____

> **How to use this worksheet**
>
> - Do the parts **in order** from top to bottom.
> - Each part has a **time** so you know how long to spend.
> - Read every instruction before you write. You can do this on your own.

Part 1 – What you will learn (about 3 minutes)

What you will learn: UX metrics are numbers that describe user experience. Examples include **task success rate**, **time on task**, **error rate**, **SUS score**, **NPS**, and **conversion rate**.

Do this:

1. **Name** one number that could show a website is easy to use.

   _____

2. **Circle** a metric that measures how long a user takes: Time on task · Brand color

Part 2 – Performance metrics (about 5 minutes)

Task success rate = successes ÷ attempts × 100. **Time on task** measures speed. **Error rate** counts mistakes per attempt.

> **Real-life scenario:** Of 20 users, 15 finish the task. Success rate = 15 ÷ 20 = 75%.

Discuss with a partner or reflect in writing: Is 75% good enough for a checkout page? Why?

Do this: Circle the correct value.

Calculation	Result
8 successes out of 10 = 80%	Correct · Wrong
3 successes out of 12 = 50%	Correct · Wrong
9 successes out of 12 = 75%	Correct · Wrong
5 out of 20 = 40%	Correct · Wrong

Part 3 – Attitude metrics (about 5 minutes)

SUS (System Usability Scale) is a 10-question survey scored from 0 to 100. **NPS** asks how likely users are to recommend a product. **CSAT** measures satisfaction.

> **Real-life scenario:** A SUS score of 68 is considered about average.

Critical thinking: Why should you combine numbers with comments?

Word bank: *SUS* · *NPS* · *CSAT* · *Success rate*

Do this: Choose the metric.

Question or data	Metric
10-question usability survey	_____
“How likely would you recommend this?”	_____
“How satisfied are you today?”	_____

Part 4 – Choosing and reading metrics (about 5 minutes)

Pick metrics that match goals. A small sample or one metric alone can mislead. Look at **trends**, not one number.

> **Real-life scenario:** Conversion rises, but the error rate also rises. Users complete purchases but make mistakes.

Discuss with a partner or reflect in writing: What does this mixed result suggest?

Do this:

1. **Write** which two metrics you would track for a school-lunch ordering app.

---

2. **Circle** the better practice: Combine metrics · Use one number only

Part 5 – Metric dashboard (about 5 minutes)

Do this: Draw a simple dashboard with three metrics and their values.

Write what decision your dashboard supports.

Part 6 – Check what you learned (about 2 minutes)

Checklist. Put a ✓ in the box when it is true for you.

☐ I can calculate **success rate**.

☐ I know **SUS**, **NPS**, and **CSAT**.

☐ I know metrics need **context**.

☐ I can combine metrics.

☐ I can pick metrics for a goal.

When all boxes are checked, you have reviewed the main ideas from this worksheet.

Worksheet on UX Metrics (Technical). Central topic: Measuring user experience. Main technology area: UX research and analytics.
